

MORAN'S DOOR

Tom Ainsworth supported an emergency HR application. He was not close to the secret system, but he was close to its people.

Tom admitted installing a useful-looking public repository. His workstation soon behaved strangely. Lestrade preserved it and a temporary server image.

The HR application served staff across Whitehall, placing ordinary administrative data beside people close to sensitive work. The extent of the compromise remained unknown.

Investigators faced two questions: what had the poisoned repository installed, and how far had the intruder travelled afterward?

The investigation showed that the useful-looking project had opened a path beyond Tom's workstation. The intruder was not interested in the application alone.

Material taken from the surrounding organisation pointed toward a person who could unknowingly carry the operation into a more protected place.

The temporary server confirmed that the intrusion belonged to the same field network Holmes had been following. One recurring mark linked the digital theft to people who arranged movement and clean exits.

The attackers had found their next unwitting participant. Holmes still did not know what they intended to deliver.

THE HOUSE WATCHES BACK

Baker Street filled with tired faces and bad news. Watson returned too early. Mycroft spoke less with every visit.

Lestrade brought back Watson's phone, recovered at Silvertown and sealed after examination. Watson placed it on the side table as if it belonged to someone else.

Mrs. Hudson noticed what the investigators missed. Watson's phone lit and went dark before anyone touched it.

Holmes placed the handset at the centre of the table. Watson suggested a delayed notification. Holmes asked why a notification had activated the camera service.

The phone had been modified during Watson's captivity. Its connection history touched the same riverside relay found in Clara Voss's records.

Two victims had been watched through different devices and one upstream path. A repeated operator mark tied both acts to the same unseen observer.

After midnight, an idle printer produced one page. The message mocked Holmes's faith in walls and described every surface as waiting for a wire.

Holmes folded the paper with more care than it deserved. Baker Street had always been their refuge. Now **the house had watched back.**

SILENT PASSENGER

The relay was not one fixed server. Clara's records and Watson's phone reached the same upstream identifier through changing access networks.

The networks formed a path through covered car parks between the Thames and Hyde Park. Cameras placed the same ordinary vehicle near several of them.

Lestrade found the car before dawn in the Pavilion Road car park. Its plates were false, its key gone, and its dashboard still glowing.

The useful evidence lay inside the head unit. Its preserved software and system services could show how an ordinary vehicle had become part of the operation.
